                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ò
                                                                                                                                                                                                                                                                                                                                                                                                 AA256331 to AA256398 represent nucleic acid molecules (I) encoding all expressed by E. coll HI, 47, H12 or 446 type strains. The present to respect a protein expressed by E. coll HI, 47, H12 or 446 type strains. The present of more than a method of detecting the presence of E. coll of a particular H serotype in a sample, comprising specifically from a hybridising a nucleic acid, preferably at least a pair, derived from a lagellating gene, specific for a particular flagellin gene associated with the H serotype, to any E. coll in the sample which contain the gene, and detecting any hybridised molecules, identifying the presence of that serotype in the sample by hybridising at least one or a pair of (I) to any E. coll in the sample by hybridising at least one or a pair of (I) to any E. coll in the sample and detecting the hybridised nucleic acid molecules; and (2) for detecting the hybridised on the serotypes of E. coll by hybridising at least one or a pair of (I) to any E. coll by hybridising at least one or a pair of (I) to any E. coll by hybridising at least one or a pair of (I) to any E. coll by hybridising at least one or a pair of (I) to any E. coll by hybridising at least one or a pair of (I) to any E. coll present in the sample and detecting the hybridised nucleic acid molecules. (I) is particularly useful for detecting the combination of O and H antigen. Hybridised (I) when using at least one (I) is detected by polymerase chain reaction (FCR). AA256399 to AA256420
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     epresent primers used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1123 GATGCAGCAAAATCGTTGCAATCTACCACCGCTCGAAACTATCGACAAAGCATG 1182

AAZ56311 to AAZ56398 represent nucleic acid molecules (I) encoding all captrof an Escherichia coli flagellin protein except a protein captrof or part of an Escherichia coli flagellin protein except a protein captrof in also deacribes a method of detecting the presence of E. coli of a particular H serotype in a sample, comprising specifically captrofically a least a part, derived from a liagellating gene, specific for a particular flagellin gene associated with the H serotype, to any E.coli in the sample which contain the gene, and detecting any hybridised molecules, identifying the presence of that serotype in the sample. (I) are useful for: (I) detecting the presence of E. coli of H serotype in a sample by hybridising at least one or a pair of (I) to any E. coli in the sample and detecting the hybridised nucleic acid molecules; and (2) for detecting the presence of both 0 and H-serotypes of E. coli by hybridising at least one or a pair of (I) to any E. coli by hybridising at least one or a pair of (I) to any E. coli by hybridising at least one or a pair of (I) is aparticularly useful for detecting the combination of 0 and H antigen. Hybridised (I) when using at least one (I) is detected by southern blot analysis and, when using at pair of (I), is detected by polymerase chain reaction of (ER). AAZ56399 to AAZ56420 represent primers used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1123 GATGCAGCAAAATCGTTGCAATCTACCACCCACCGGTCGAAACTATCGACAAAGCATG 1182

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    õ
                                                                                                                                                                                     AAZ56311 to AAZ56398 represent nucleic acid molecules (I) encoding all cypart of an Escherichia coli flagellin protein except a protein expersade by E. coli HI, H7, H12 or H48 type strains. The present of invention also describes a method of detecting the presence of E. coli of a particular H serotype in a sample, comprising specifically particular a nucleic acid, preferably at least a pair, derived from a flagellating gene, specific for a particular flagellin gene associated with the H serotype, to any E. coli in the sample which contain the gene, and detecting any hybridised molecules, identifying the presence of that serotype in the sample. (I) are useful for: (I) detecting the presence of E. coli of H serotype in a sample by hybridising at least one or a pair of (I) to any E. coli in the sample and detecting the hybridised nucleic acid molecules; and (2) for detecting the presence of both 0 and H-serotypes of E. coli by hybridising at least one or a pair of (I) to any E. coli by hybridised (I) when using a pair of (I) cony E. coli by hybridised (I) when using a pair of (I) is detected by southern blot analysis and, when using a pair of (I), is detected by polymerase chain reaction (PCR). AAZ56399 to AAZ56420 represent primers used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  2 AspAlaLeuGluAlaLeuAlaAspGlnThrAspAlaLeuGlnSerGluGluAlaAlaVal 21

expressed by E. coli H1, H7, H12 or H48 type strains. The protein except a protein expressed by E. coli H1, H7, H12 or H48 type strains. The protein expressed by E. coli H1, H7, H12 or H48 type strains. The protein control of a particular H serotype in a sample, comprising specifically hybridising a nucleic acid, preferably at least a pair, derived from a flagellating gene, specific for a particular flagellin gene associated with the H serotype, to any E. coli in the sample which contain the gene, and detecting any hybridised molecules, identifying the presence of that serotype in the sample. (I) are useful for: (I) detecting the presence of E. coli of H serotype in a sample by hybridising at least one or a pair of (I) to any E. coli in the sample and detecting the hybridised nucleic acid molecules; and (2) for detecting the presence of both O and H serotype of E. coli by hybridising at least one or a pair of (I) to any E. coli in the sample and detecting the hybridised nucleic acid molecules. (I) is particularly useful for detecting the combination of O and H antigen. Hybridised (I) when using a pair of (I), is detected by southern blot analysis and, when using a pair of (I), is detected by oblymerase chain reaction (PCR). AAZS6399 to AAZS6420 represent primers used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAZ56331 to AAZ56398 represent nucleic acid molecules (I) encoding all
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  2 AspAlaLeuGluAlaLeuAlaAspGlnThrAspAlaLeuGlnSerGluGluAlaAlaVal 21
                                                                                                                                                                                                                        Novel nucleic acid molecule useful for the detection of flagellated bacterial strains in food, faeces, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Escherichia coli flagellin protein nucleotide sequence SEQ ID NO:21.

AA256331 to AA256398 represent nucleic acid molecules (I) encoding all cypart of an Escherichia coli flagellin protein except a protein expressed by E. coli H1, H7, H12 or H48 type strains. The present to revention also describes a method of detecting the presence of E. coli of a particular H serotype in a sample, comprising specifically.

Comparising a nucleic acid, preferably at least a pair, derived from a flagellating gene, specific for a particular flagellin gene associated with the H serotype, to any E.coli in the sample which contain the gene, and detecting any hybridised molecules, identifying the presence of that serotype in the sample. (I) are useful for: (I) detecting the presence of that serotype in a sample by hybridising at least one or a pair of (I) to any E. coli in the sample and detecting the hybridised nucleic acid molecules; and (2) for detecting the presence of both O and H serotypes of E. coli by hybridising at least one or a pair of (I) to any E. coli present in the sample and detecting the hybridised nucleic acid molecules. (I) is particularly useful for detecting the combination of O and H antigen. Hybridised (I) when using at least one combination of O and H antigen. Hybridised (I) when using at least one (I) is detected by polymerase chain reaction (POR). AA256399 to AA256420 is because the primers used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   expressed sequence tag; Fusarium venenatum; Aspergillus niger; Aspergillus oryvae; Trichoderma reesel; identification; recombination; culture condition; environmental stress; spore morphogenesis; metabolic pathway engineering; catabolic pathway engineering; ss.

Expression of genes in a first filamentous fungal (FF) cell relative to expression of genes in a first filamentous fungal (FF) cell relative to expression of genes in one or more second filamentous fungal cells. The method uses fluorescence—labeled nucleic acids isolated from the FF cells and a substrate of expressed sequence tags (EST). The ESTS care used in the methods for monitoring differential expression of genes in a first filamentous fungal (FF) cell relative to expression of genes from FF cells allows the production of potential of potential of the microcrganisms to be improved. New genes may be cliscovered, possible functions of unknown open reading frames can be discovered, possible functions of unknown open reading frames can be considered. The expression of genes can be used to study how FF cells dentified and gene copy number variation and stability can be considered. The expression of genes can be used to study how FF cells adapt to changes in culture conditions, environmental stress, spore conspined in culture conditions, environmental stress, spore candom consorting using ESTS provides several advantages over genomic or random consorting including alimination of redundancy as one spot on a raray equals one gene or open reading frame, and organisation of the canlysis of the results. AAF11248 to AAF11247 represents ESTS from Aspergillus or SaPariany and AAF11487 to Presents ESTS from AAF14879 to AAF1851 to Present ESTS from Aspergillus suck and SaPariany and Inspecifically claimed in the present invention.

sequences; AAA81260 to AAA81303 and AAB25620 to AAB25663 represent
Neisseria DNA sequences and their corresponding proteins; AAA81254 to
AAA81259 and AAA81304 to AAA81312 represent PCR primers used in the
isolation of Neisseria meningitidis DNA sequences; and AAA8132 to
AAA81452 represent Neisseria meningitidis MenB polynucleotide ORF
sequences, which are all used in the exemplification of the present
invention. The nucleic acid sequences, protein sequences, and antibodies
against them, can be used in the manufacture of a composition. The
composition can be used as a medicament (or in the manufacture of a
medicament) for treating, preventing or disquesting infection due to
Neisserial bacteria. For example, some of the identified proteins could
be components of vaccines against Meningococcus B; against all serotypes;
and/or against all pathogenic Neissariae. Identification of sequences
from the bacterium will also facilitate production of bloogical probes,
particularly organism-specific probes. Attempts to make efficacious
Meningococcus B vaccines have falled mally due to antigen tolerance.
Multivalent vaccines have also been tried but none have successfully
overcome antigenic variability. The provision of further, complete
exposed proteins that may be presumed targets for the immune system and
which are not antigenically variable or at least more conserved than
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                411891 GCTTTGGAAGCGCGTTTGGAAAAACTCGAAGCCGCGCAAAATCCCGAACGGGCAGCATG 411950

CHIR ) CHIRON CORP.

98US-0103794.

09-0CT-199B; 30-APR-1999; Isolated nucleotide sequences of Neisseria meningitidis which can be used in the diagnosis and treatment of N. meningitidis infection and other Neisserial infections, for example, N.gonorrhoea  $\cdot$ 

The present invention describes methods of obtaining immunogenic proteins from Neisseria genomic sequences. AAA81453 to AAA82414 represent specifically claimed Neisseria meningitidis genomic DNA

Claim 7; Page 866-1272; 1760pp; English.

The sequences in AAF21544 and AAF21607 Neisseria meningitidis B (NMB). The sequences in AAF21544 and AAF21607 to AAF21613 represent fragments of the NMB genomics sequence, as the sequence was too long to go in a record on its own it was split into B sequences which overlap each other at the beginning and end of each sequence by 49980 bp (i.e. the last 49980 bp of AAF21607 are repeated at the beginning of AAF21607, the last 49980 bp of AAF21607 are repeated the beginning of AAF21608, and so on). AAF2155 to AAF2188 encode the Neisseria proteins given in AAB58550 to AAB58931, and AAF21889 to the PAR21606 represent PCR primers which are used in the exemplification of the present invention. The NMB genome and fragments from it have antibacterial activity, and can be used in vaccines and gene therapy.

```
The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a
Neisseria nucleic acids, proteins and/or antibodies which binds to the proteins can be used in compositions for treating or preventing infection due to Neisserial bacteria or as a diagnostic reagent for detecting the presence of Neisserial bacteria constitution of antibodies raised to Neisserial bacteria. Computers, computer memory, computer storage medium or computer databases can be used in a search to identify open reading frames (ORFs) or coding sequences within the NMB genome. The DNA sequences provide further opportunities to find antigenic or immunogenic proteins which are more effective in vaccines than the outer membrane proteins currently used.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Db 111891 GCTTFGGAAGCGCGTTFGGAAAAACTCGAAGCCGCGCAAAATCCCGAAAAACTCGAAGCGGCAGCATG 111950

The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacterium coryneform bacteria are useful for producing amino acids, nucleic acids, vitamine, saccharides and organic acids, particularly L-lysine. The present sequence is a nucleic acid described in the exemplification of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the Claim 8; SEQ ID NO: 556; 246pp + Sequence Listing; English. Patent Office. European

The present invention describes methods of obtaining immunogenic proteins from Neisseria genomic sequences. AAAB1453 to AAAB2414

represent specifically claimed Neisseria meningitidis genomic DNA sequences; AAAB1260 to AAAB1303 and AAB1563 to present to AAB1261 to AAAB2563 represent to AAAB1304 to AAAB1301 represent PCR primers used in the sequences; and AABB1324 to AAAB1452 represent meningitidis DNA sequences; and AAAB1324 to AAAB1452 represent Neisseria meningitidis MenB polynucleotide ORF sequences; which are all used in the exemplification of the present invention. The nucleic acid sequences, protein sequences, and antibodies against them, can be used in the manufacture of a composition can be used as medicament (or in the manufacture of a medicament) for treating, preventing or diagnosing infection due to medicament) for treating, preventing or diagnosing infection of sequences against Menhagococcus B; against all servoypes; and/or against all pathogenic Neisseriae. Identification of sequences and/or against all pathogenic Neisseriae. Identification of sequences and/or against all pathogenic Neisseriae. Identification of sequences of particularly organism specific probes. Attempts to make efficacious Meningococcus B vaccines have failed mainly due to antigen tolerance. Multivalent vaccines have also been tried but none have successfully overcome antigenic variability. The provision of further, complete sequences may provide an opportunity to identify secreted or surface exposed proteins that may be presumed targets for the immune system and which are not antigenically variable or at least more conserved than and the argets for the immune system and conserved than and the argets for the immune system and conserved than and the argets for the immune system and conserved than and the argets for the immune system and conserved than and the argets for the immune system and conserved than and the argets for the immune system and conserved than and the argets for the argets for the argets for the argets for the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Tettelin H, Venter JC;

The method uses fluorescence-labeled nucleic acids isolated from the relative to expression of genes for a first filamentous fungal (FF) cell relative to expression of genes for a first filamentous fungal (FF) cell relative to expression of the same genes in one or more second filamentous fungal cells. Monitoring the global expression of genes from FF cells allows the production of the global expression of genes from FF cells allows the production contained of the microorganisms to be improved. New genes may be discovered, possible functions of unknown open reading frames can be identified and gene copy number variation and stability can be discovered, possible functions of unknown open reading frames can be used to changes in culture conditions, environmental stress, spore compineering. Using ESTs provides several advantages over genomic or random cDNA clones including elimination of redundancy as one spot on an crandom cDNA clones including elimination of repensents ESTs from Aspergillus or Fusarium venematum; AAFI1348 to AAFI1347 represents ESTs from Aspergillus or all and encount in the presents ESTs from Aspergillus or all and encount in the present in the present of a procession of the contained in the presents ESTs from Aspergillus or all and encounts in the contained in the present in the present in the present in the present in the present in the present in the present in the present in the present in the present in the present in the present in the present in the present in the present in the present in the present in the present in the present in the present in the present in the present in the present in the present in the present in the present in the present in the present in the present in the present in the present in the present in the present in the present in the present in t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Monitoring differential expression of genes in filamentous fungal cells uses fluorescence-labeled nucleic acids isolated from the cells and a substrate of expressed sequence tags -

The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a nucleic acid described in the examplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Db 4036256 TTGATGGACGCGCGACCTGCTGGAAGGCGAACAGGTAACCATCGTCGATATCGACAAC 4036197
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to evaluating strain variation within and between different populations of the tuberculosis bacterial pathogen, Mycobacterium tuberculosis or related Mycobacterium by determining the nuclectide sequence of the first strain at positions in the complete sequence of the genome that correspond to positions that differ in the nuclectide sequences of M. tuberculosis strains CDC 1551 (AAI99683) and H37Rv (AAI99682). The method is useful for evaluating strain variation of M. tuberculosis and has valuable application in the fields of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             BP; 757105 A; 1447799 C; 1441301 G; 757371 T; 189 other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at seqdata.uspto.gov/sequence.html?DocID=6294328B1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Evaluating strain variation of Mycobacterium tuberculosis, comprises determining the nucleotide sequence of the strain at positions in the genome corresponding to positions where M. tuberculosis strains CDC 1551 and H37Rv differ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     7 LeualaaspGlnThrAspAlaLeuGlnSerGluGluAlaAlaValValLysAlaAspAsn 26

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to evaluating strain variation within and between different populations of the tuberculosis bacterial pathogen, Mycobacterium tuberculosis or related Mycobacterium by determining the nuclectide sequence of the first strain at positions in the complete sequence of the genome that correspond to positions that differ in the nuclectide sequences of M. tuberculosis strains CDC 1551 (AA199683) and H37PV (AA199682). The method is useful for evaluating strain variation of M. tuberculosis and has valuable application in the fields of tuberculosis genetics, epidemiology, patient treatment and epidemic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at seqdata.uspto.gov/sequence.html?DocID=629432881.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 4411529 BP; 758565 A; 1449983 C; 1444602 G; 758379 T; 0 other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              determining the nucleotide sequence of the strain at positions in the genome corresponding to positions where M. tuberculosis strains CDC 1551 and H37Rv differ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Evaluating strain variation of Mycobacterium tuberculosis, comprises

sequences (ABL01840-ABL16175) and the encoded proteins (ABB77737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions \cdot
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental blology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an isolated nucleic acid detection reagent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  3 AlaLeuGluAlaLeuAlaAspGlnThrAspAlaLeuGlnSerGluGluAlaAlaValVal
                                                                                                                                                                                                                                                                                                           developmental biology; cell signalling; insecticide;

The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABB57377-ABB72072).

The sequence data for this patent did not form part of the printed security in the contraction, but was obtained in electronic format directly from WIPO

The present sequence is the genome sequence of Listeria monocytogenes ECD-e. This sequence and fragments of this sequence are useful for selecting probes and primers for detecting genes in L. monocytogenes and related organisms, and to study genetic polymorphisms and other genomes. Proteins (ABB47297-ABB50149) expressed from the present sequence are useful for raising specific antibodies, identification of L. monocytogenes and related organisms, and for biosynthesis and blodegradation, especially blosynthesis of Vitamin B12. This sequence and proteins encoded by it are also useful for selecting compounds that regulate gene expression and cell replication and modulate L. monocytogenes-related diseases. In addition, this sequence and proteins encoded by it are useful in pharmaceutical and vaccines compositions for the treatment or prevention of infections by L. monocytogenes and related the Note: The sequence data for this patent did not form part of t specification, but was obtained in electronic format directly organisms.

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, and gene mapping, and in recombinant production of (II). The cand gene mapping, and in recombinant production of (II). The cand gene mapping and in recombinant production of (II). The polypeptides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques or restore normal activity of (II) or to treat disease states involving (II) and its binding mathodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating clasorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in casponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and cand to produce other types of data and products dependent on DNA and diagnostic coding sequences of the invention classes the printed diagnostic coding sequences of the invention of the printed product of the product of the product of the product of the printed product of the invention of the printed product of the product of the product of the product of the product of the product of the printed product of the product of the printed product of the product of the printed product of the printed product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher enkaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention sequences spenant. DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                         New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions \cdot

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from prosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     detection reagent for detecting 1000 or more for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           2 AspalaLeuGluAlaLeuAlaAspGlnThrAspAlaLeuGlnSerGluGluAlaAlaVal 21

The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher enkaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

```

```
New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 2 AspalaLeuGluAlaLeuAlaAspGlnThrAspAlaLeuGlnSerGluGluAlaAlaVal 21
                                                                                                                                                                                                         polynucleotide SEQ ID NO 32531.
                                                                                                                                                                                                                                                                     developmental biology; cell signalling; insecticide;

The invention i useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention signatorics genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072).

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                        4 LeuGluAlaLeuAlaAspGlnThrAspAlaLeuGlnSerGluGluAlaAlaValValLys 23

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL016176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wlpo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions -

Recombinant or substantially pure preparations of H. pylori polypeptides are disclosed, together with the nucleic acids encoding them. In all, 73 ORFS are shown. The proteins are variously cell envelope proteins, secreted proteins or other cellular vaccines containing the nucleic acids or proteins are claimed, as are probes containing at least 8 nucleotides from the nucleic acid sequences. The vaccines are useful for treating or reducing the risk of H. pylori infections, and the
           identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher enkaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLi6176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
probes can be used diagnostically for detecting the presence of Helicobacter in a sample. The products are also of use in screening for compounds having the ability to interfere with the H. pylori life cycle or to inhibit H. pylori infection.
                                                                                                                                                                                                                                                                           4 LeuGluAlaLeuAlaAspGlnThrAspAlaLeuGlnSerGluGluAlaAlaValValLys
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Drosophila melanogaster expressed polynucleotide SEQ ID NO 35063.

The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors. The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino act sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide

```
The present sequence encodes a H. pylori secreted or periplasmic protein. The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors. The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides,
                                                                                                                                                                                                                                                                          Helicobacter pylori nucleic acid sequences and related polypeptide(s) - useful for vaccines to treat or prevent H. pylori infection, and to detect Helicobacter
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Cytoplasmic; vaccine; prevention; treatment; infection; envelope; identification; binding compound; bacterium; life cycle; activator; bacteria; inhibitor; duodenal ulcer disease; chronic gastritis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     H. pylori secreted or periplasmic protein ORF 02ce10216orfl.

related alpha2M binding process. If the process progenes which have the ability to bind alpha2-macroglobulin (alpha2M) and show homology to protein G of group G Streptococcus. GRAB protein and peptides derived from it are used in vaccine compositions for generating a protective immune response against group A Streptococcus. Antibodies against GRAB are useful for treating Streptococcus pyogenes infections. The protein is also useful for purifying alpha2M from a sample. The present sequence is a DNA encoding partial GRAB protein from S. pyogenes strain AP49. The protein has alpha2M binding region and is useful in vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New alpha2M binding protein for generating a protective immune response to group A streptococcus and purifying the binding protein \,
The patent discloses a new family of proteins termed GRAB (protein G

GRAB protein and peptides derived from it are used in vaccine compositions for generating a protective immune response against group A Streptococcus. Antibodies against GRAB are useful for treating Streptococcus pyogenes infections. The protein is also useful for purifying alpha2M from a sample. The present sequence is a DNA encoding partial GRAB protein from S. pyogenes strain KTLB.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            a protective immune response binding protein -
                                                                                                                                                                                                                                          Streptococcus pyogenes strain KTL9 partial GRAB protein encoding DNA.

GRAB protein and peptides derived from it are used in vaccine compositions for generating a protective from it are used in vaccine compositions for generating a protective farmune response against group A Streptococcus. Antibodies against GRAB are useful for treating Streptococcus pyogenes infections. The protein is also useful for purifying appha2M from a sample. The present sequence is a DNA encoding full-length GRAB protein from S. pyogenes strain SF370.
                                                                                                                                                                                                                                                             New alpha2M binding protein for generating a protective immune response to group A streptococcus and purifying the binding protein \,

The patent discloses a new family of proteins termed GRAB (protein G related alpha2M binding protein) from Streptococcus pyogenes which have the ability to bind alpha2-macroglobulin (alpha2M) and show homology to protein G of group G Streptococcus. GRAB protein and peptides derived from it are used in vaccine compositions for generating a protective manner response against group A Streptococcus. Antibodies against GRAB are useful for treating Streptococcus pyogenes infections. The protein is also useful for purifying alpha2M from a sample. The present sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The patent discloses a new family of proteins termed GRAB (protein G related alpha2M binding protein) from Streptococcus pyogenes which have the ability to bind alpha2-macroglobulin (alpha2M) and show homology to protein G of group G Streptococcus. GRAB protein and peptides derived from it are used in vaccine compositions for generating a protective immune response against group A Streptococcus. Antibodies against GRAB are useful for treating Streptococcus pyogenes infections. The protein is also useful for purifying alpha2M from a sample. The present sequence is a DNA encoding partial GRAB protein from S. pyogenes strain API. The protein has alpha2M binding region and is useful in vaccine
                                                                                                                                                                                                                                                                         New alpha2M binding protein for generating a protective immune response to group A streptococcus and purifying the binding protein \,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Streptococcus pyogenes strain KTL3 partial GRAB protein encoding DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    GRAB protein; protein G related alpha2M binding protein; vaccine; alpha2-macroglobulin; group A Streptococcus; GAS; antibiotic; immune response; Streptococcus pyogenes infection; ds.

The patent discloses a new family of proteins termed GRAB (protein G related alpha2M binding protein) from Streptococcus pyogenes which have the ability to bind alpha2-macroglobulin (alpha2M) and show homology to protein G of group G Streptococcus. GRAB protein and peptides derived from it are used in vaccine compositions for generating a protective immune response against group A Streptococcus. Antibodies against GRAB are useful for treating Streptococcus pyogenes infections. The protein is a DNA encoding partial GRAB protein from a sample. The present sequence is a DNA encoding partial GRAB protein from S. pyogenes strain KTL3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New alpha2M binding protein for generating a protective immune response to group A streptococcus and purifying the binding protein \,

Streptococcus pyogenes strain AP1 partial GRAB protein encoding DNA.

GRAB protein; protein G related alpha2M binding protein; vaccine; alpha2-macroglobulin; group A Streptococcus; GAS; antibiotic; immune response; Streptococcus pyogenes infection; ds.

Location/Qualifiers 1..468

Key

Streptococcus pyogenes.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                              hypothetical protein M01B12.4 - Caenorhabditis elegans
C.Species: Caenorhabditis elegans
C.Species: Caenorhabditis elegans
C.Species: Caenorhabditis elegans
C.Accession: T33170
B.Becker, M.; Graves, T.; Czersky, P.
Submitted to the EMBL Data Library, May 1998
A.Description: The sequence of C. elegans cosmid M01B12.
A.Reference number: 221297
A.Accession: T33170
A.Status: preliminary; translated from GB/EMBL/DDBJ
A.Molecule type: DNA
A.Molecule type: DNA

A Residues: 462-477,'D',479-563;674-762,'A',763-771 CTAK>

C; Comment: This protein plays a vital role in the regulation of smooth muscle and nonmus C; Comment: The binding of caldesmon to F-actin is modulated by calcium and calmodulin.

C; Comment: Two calmodulin molecules can bind to nonoverlapping domains of each caldesmon C; Superfamily: caldesmon c; Superfamily: caldesmon attin binding; alternative splicing; calmodulin binding; cytoskeleton; muscl

F;1-771/Product: h-caldesmon #status predicted <HMAT>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A; Molecule type: mRNA

As Description: Primary structure of the herpesvirus saimiringenome.

A; Description: Primary structure of the herpesvirus saimiringenome.

A; Reference number: A36806

A; Rolecule type: DNA

A; Residues: 1-407 < ALB>
A; Cross references: GB: X64346; NID: 960320; PIDN: CAA45696.1; PID: 960394

A; Rabrecht, J.C.; Nicholas, J.; Biller, D.; Cameron, K.R.; Blesinger, B.; Newman, C.;

A; Title: Primary structure of the herpesvirus saimiringenome.

A; Reference number: A37309; MuiD: 9233688

A; Contents: annotation; possible protein-coding frames

A; Contents: annotation; possible protein-coding frames

"Mouse pl50Glued (dynactin 1) cDNA sequence and evaluation as a candidate for the neuromuscular disease mutation mnd2.";
Biochem Biophys Res. Commun. 231:344-34(1997).
-!- FUNCTION: REQUIRED FOR THE CYTOPLASMIC DYNEIN-DRIVEN RETROGRADE MOVEMENT OF VESICLES AND ORGANELLES ALONG MICROTUBULES. DYNEIN-DYNACTIN INTERACTION IS A KEY COMPONENT OF THE MECHANISM OF AXONAL TRANSPORT OF VESICLES AND ORGANELLES.
-!- SUBUNIT: LARGE MACROMOLECULAR COMPLEX. OF AT LEAST 10 COMPONENTS.
PLSOGLUED) BINDS DIRECTLY TO MICROTUBULES AND TO CYTOPLASMIC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              :|| : : | : ::|| | | : :|| | 964 EELSEANVRXSLLEKKLDSAAKDADERIEKVQTRLDETQTLLRKKEKDFEETMDALQADI 1023
